## A BLUFFER'S GUIDE

1. How to talk about Reaction Rate rate $=\Delta[$ chemical $] / \Delta$ time

- Common Units: $\mathrm{M} / \mathrm{s}, \mathrm{mol} \cdot \mathrm{L}^{-1} \cdot \mathrm{~s}^{-1}$
- Rate of disappearance of reactant or Rate of appearance of product
- Use coefficients to change one rate to another

$$
\begin{aligned}
& \text { Reaction: } 2 \mathrm{~A}+3 \mathrm{~B} \rightarrow 4 \mathrm{C} \\
& -\frac{1}{2} \frac{\Delta[\mathrm{~A}]}{\Delta \mathrm{t}}=-\frac{1}{3} \frac{\Delta[\mathrm{~B}]}{\Delta \mathrm{t}}=\frac{1}{4} \frac{\Delta[\mathrm{C}]}{\Delta \mathrm{t}}
\end{aligned}
$$

Watch your signs $(-\Delta[$ React. $]=\Delta[$ Prod. $])$
2. From a graph of $[R]$ vs time

Average rate is the slope of a segment.
Instantaneous rate is slope of the tangent.
Initial rate is often used.
3. How to Speed Up a Reaction Use Collision Theory and
Kinetic Molecular Theory
increase the concentration of reactants

- increase molarity of solutions
- increase partial pressure of gases collision model $\rightarrow$ more collisions
more surface area between unlike phases collision model $\rightarrow$ more collisions
increase the temperature collision model $\rightarrow$ more \& harder collisions
add a catalyst
- homogeneous catalyst (used \& reformed)
- heterogeneous catalyst (surface catalyst)
collision model $\rightarrow$ alternate mechanism/ pathway that needs lower energy collision and/or helps correct orientation

4. Because Rate depends on Concentration...
we use Rate Laws

- what they mean
- how to determine them
- how they relate to rate determining step
- how they help you choose a mechanism

5. General Form:

Equation: $A+B \rightarrow C$
Rate $=k[A]^{x}[B]^{y}$
$k$ is the "specific rate constant" Use experimental data to determine the values of $x, y$, and $k$.
6. The Rate Law CANNOT be determined from the overall reaction.

- It MUST be determined experimentally because the rate law reflects only the "rate determining step."

7. Rate law can be determined from initial rates. See your notes and worksheets!

- Hold [ ] of all chemicals except one constant.
- Change [ ] of one chemical and see how it changes the rate.
- Determine what the exponent order must be to result in that change.
- If $[A]$ doubles, and rate quadruples, then $[A]$ must be raised to the $2^{\text {nd }}$ power. $[A]^{2}$, it is second order with respect to $A$

8. Rate Law matches Molecularity of the Rate Determining Step in the Mechanism

Examples for: $2 A+3 B \rightarrow C$

| Rate Law | Rate Determining Step <br> in the mechanism |
| :--- | :--- |
| Rate $=\mathrm{k}[\mathrm{A}][\mathrm{B}]$ | $\mathrm{A}+\mathrm{B} \rightarrow \mathrm{X}$ (slow) |
| Rate $=\mathrm{k}[\mathrm{A}]^{2}$ | $\mathrm{~A}+\mathrm{A} \rightarrow \mathrm{X}$ (slow) |
| Rate $=\mathrm{k}[\mathrm{A}]^{2}[\mathrm{~B}]$ | $\mathrm{A}+\mathrm{A} \leftrightarrows \mathrm{X} \mathrm{(fast)}$ <br> $\mathrm{~B}+\mathrm{X} \rightarrow \mathrm{Y}$ (slow) <br> Each step is usually <br> bimolecular. A 3rd order <br> overall rxn often comes from <br> a fast equilibrium before a <br> slow step. |
| Rate $=\mathrm{k}$ | This could be a mechanism <br> that depends on a catalyst <br> only. The concentrations <br> would not matter. |

9. Determining the order by graphing

|  | order | straight-line <br> plot |  |  | slope |
| :---: | :---: | :---: | :---: | :---: | :---: |
| C <br> Concentration | 0 | $[\mathrm{~A}]_{\mathrm{t}}$ | vs. | t | -k |
| N <br> Natural Log | 1 | $\ln [\mathrm{~A}]_{\mathrm{t}}$ | vs. | t | -k |
| R <br> Reciprocal | 2 | $1 /[\mathrm{A}]_{\mathrm{t}}$ | vs. | t | k |

10. PE energy profile of a reaction

$\Delta H$ of the reaction relates reactant and product PE's / exo- or endothermic/ downhill, $-\Delta \mathrm{H}$, or uphill, $+\Delta \mathrm{H}$
11. Activation energy $\left(\mathrm{E}_{\mathrm{a}}\right)=$ energy barrier

- Activated complex (transition state) is at the peak of the graph.
- Whether a rxn is fast or slow depends on the activation energy in the PE profile
- PE profile does not change with change in temperature of the reactants?
- Adding a catalyst lowers the $\mathrm{E}_{\mathrm{a}}$

12. The KE distribution of a substance

- Temperature is the average KE
- Increasing temperature spreads out curve to the right, increases average KE

- Adding a catalyst moves the threshold energy to the left.

13. Reaction mechanisms how the reaction happens step by step Overall reaction:
$4 \mathrm{HBr}+\mathrm{O}_{2} \rightarrow 2 \mathrm{Br}_{2}+2 \mathrm{H}_{2} \mathrm{O}$

> Mechanism:
> $\mathrm{HBr}+\mathrm{O}_{2} \rightarrow \mathrm{HOOBr}$ $\mathrm{HOOBr}+\mathrm{HBr} \rightarrow 2 \mathrm{HOBr}$ $\mathrm{HOBr}+\mathrm{HBr} \rightarrow \mathrm{Br}_{2}+\mathrm{H}_{2} \mathrm{O}$ $\mathrm{HOBr}+\mathrm{HBr} \rightarrow \mathrm{Br}_{2}+\mathrm{H}_{2} \mathrm{O}$

NOTE: HOOBr and HOBr are not in the overall rxn because they are not reactants or products, they are "intermediates." We don't like putting intermediates into our rate laws, we often will substitute things to make them not show up.

- Overall reaction is sum of steps
- Slowest step is rate-determining step

14. Half-Life

- relationship to radioactivity (a first order reaction)

| Order | Half-Life |
| :---: | :---: |
| 0 | $\frac{[A]_{0}}{2 k}$ |
| $1^{*}$ | $\frac{0.693}{k}$ |
| 2 | $\frac{1}{k[A]_{0}}$ |

*This is the one that typically shows up on the AP exam.
15. Arrhenius Equation
$k=A e^{\frac{-E_{a}}{R T}}$
Graphing to find $E_{a}$
Graph: $\ln (\mathrm{k})$ vs $1 / \mathrm{T}$
$\ln (k)=-\frac{E_{a}}{R}\left(\frac{1}{T}\right)+\ln (A)$
$\frac{-E_{a}}{R}=$ slope
$\ln (A)=y$-intercept
