Hess's Law

## Hess's Law

"In going from a particular set of reactants to a particular set of products, the change in enthalpy is the same whether the reaction takes place in one step or a series of steps."

## Hess's Law

Path A - Mrs. Farmer cleaning the house.
Path B - Mr. Farmer cleaning the house.

Regardless of the path taken, you still get to the same place.

Although Path B drives Mrs. Farmer bonkers - Ha!

## Relationships Involving $\Delta H_{r x n}$

Multiplying Rxn by a \# to Change Coefficients $\Delta H_{\mathrm{rxn}}$ is multiplied by that factor.

- Because $\Delta H_{\mathrm{rxn}}$ is extensive - depends on the amount of substance

$$
\mathrm{C}(s)+\mathrm{O}_{2}(g) \rightarrow \mathrm{CO}_{2}(g)
$$

$$
2 \mathrm{C}(s)+2 \mathrm{O}_{2}(g) \rightarrow 2 \mathrm{CO}_{2}(g) \quad \Delta H=2 \times(-393.5 \mathrm{~kJ})=-787.0 \mathrm{~kJ} .
$$

Reversing a rxn to flip which side the products/reactants are on Flip the sign of $\Delta H$, if positive now negative, if negative, now positive

$$
\begin{aligned}
& \mathrm{C}(s)+\mathrm{O}_{2}(g) \rightarrow \mathrm{CO}_{2}(g) \\
& \mathrm{CO}_{2}(g) \rightarrow \mathrm{C}(s)+\mathrm{O}_{2}(g)
\end{aligned}
$$

$$
\Delta H=-393.5 \mathrm{~kJ}
$$

$$
\Delta H=-(-393.5)=+393.5 \mathrm{~kJ}
$$

## Standard Conditions

## Standard State

The state of a material at a defined set of conditions.

- Pure gas at 1 atm pressure
- Pure solid or liquid in its most stable form at 1 atm pressure and temperature of interest (usually $25^{\circ} \mathrm{C}$ )
- Substances in a solution with a 1M concentration

## Standard Enthalpy Change

## Standard Enthalpy Change

$\Delta \mathrm{H}^{\circ}$ - the Enthalpy change when all reactants and products are in their standard states.

That's what the ${ }^{\circ}$ symbol means - that it is under the standard conditions. You can have $\Delta \mathrm{H}$ values that are not at standard conditions, then you leave the ${ }^{\circ}$ off.

## Standard Enthalpy of Formation

## Standard Enthalpy of Formation

$\Delta \mathrm{H}_{\mathrm{f}}$ - the Enthalpy change for the reaction forming 1 mole of a pure compound from its constituent elements.

- Elements must be in their standard states
- $\Delta \mathrm{H}_{\mathrm{f}}^{\circ}$ for a pure element in its standard state $=0 \mathrm{~kJ} / \mathrm{mol}$ That includes diatomic gases! They are still pure elements!

## Hess's Law Example Problem \#1

Calculate $\Delta \mathrm{H}$ for the combustion of methane, $\mathrm{CH}_{4}$ :
$\mathrm{CH}_{4}+2 \mathrm{O}_{2} \rightarrow \mathrm{CO}_{2}+2 \mathrm{H}_{2} \mathrm{O}$

## Step \#1:

$\mathrm{CH}_{4}$ must appear on the reactant side, so we reverse reaction \#1 and change the sign on $\Delta \mathrm{H}$.

$$
-r \times n 1 \quad \mathbf{C H}_{4} \mathbf{\rightarrow} \mathbf{C}+\mathbf{2 H}_{\mathbf{2}}
$$

| $\#$ | Reaction | $\Delta \mathrm{H}^{\mathrm{o}}$ |
| :---: | :---: | :---: |
| 1 | $\mathrm{C}+2 \mathrm{H}_{2} \rightarrow \mathrm{CH}_{4}$ | -74.80 kJ |
| 2 | $\mathrm{C}+\mathrm{O}_{2} \rightarrow \mathrm{CO}_{2}$ | -393.50 kJ |
| 3 | $\mathrm{H}_{2}+1 / 2 \mathrm{O}_{2} \rightarrow \mathrm{H}_{2} \mathrm{O}$ | -285.83 kJ |

+74.80 kJ

## Hess's Law Example Problem \#1

Calculate $\Delta \mathrm{H}$ for the combustion of methane, $\mathrm{CH}_{4}$ :
$\mathrm{CH}_{4}+2 \mathrm{O}_{2} \rightarrow \mathrm{CO}_{2}+2 \mathrm{H}_{2} \mathrm{O}$

## Step \#2:

Keep reaction \#2 unchanged, because $\mathrm{CO}_{2}$ belongs on the product side

| $\#$ | Reaction | $\Delta \mathrm{H}^{\circ}$ |
| :---: | :---: | :---: |
| 1 | $\mathrm{C}+2 \mathrm{H}_{2} \rightarrow \mathrm{CH}_{4}$ | -74.80 kJ |
| 2 | $\mathrm{C}+\mathrm{O}_{2} \rightarrow \mathrm{CO}_{2}$ | -393.50 kJ |
| 3 | $\mathrm{H}_{2}+1 / 2 \mathrm{O}_{2} \rightarrow \mathrm{H}_{2} \mathrm{O}$ | -285.83 kJ |

$$
\begin{array}{ll}
\operatorname{rxn} 1 & \mathrm{CH}_{4} \rightarrow \mathrm{C}+\mathrm{CH}_{2} \\
\operatorname{rxn} 2 & \mathrm{C}+\mathrm{O}_{2} \rightarrow \mathrm{CO}_{2}

Calculate $\Delta \mathrm{H}$ for the combustion of methane, $\mathrm{CH}_{4}$ :
$\mathrm{CH}_{4}+2 \mathrm{O}_{2} \rightarrow \mathrm{CO}_{2}+2 \mathrm{H}_{2} \mathrm{O}$

## Step \#3:

Use reaction \#3 to get water as a product, but multiply it by 2 since you have $2 \mathrm{H}_{2} \mathrm{O}$

| $\#$ | Reaction | $\Delta \mathrm{H}^{\mathrm{o}}$ |
| :---: | :---: | :---: |
| 1 | $\mathrm{C}+2 \mathrm{H}_{2} \rightarrow \mathrm{CH}_{4}$ | -74.80 kJ |

-r \times n 1 & \mathrm{CH}_{4} \rightarrow \mathbf{C}+\mathbf{2 H}_{2} \\
r \times n n_{2} & \mathrm{C}+\mathbf{O}_{2} \rightarrow \mathrm{CO}_{2} \\
2 \times r \times n 3 & \mathbf{2 \mathrm { H } _ { 2 }}+\mathbf{O}_{\mathbf{2}} \rightarrow \mathbf{2} \mathbf{H}_{\mathbf{2}} \mathbf{O}
\end{array}
$$

$\mathrm{CH}_{4}+2 \mathrm{O}_{2} \rightarrow \mathrm{CO}_{2}+2 \mathrm{H}_{2} \mathrm{O}$

## Step \#4:

Cross out things that show up on both sides, then sum up your $\Delta \mathrm{H}$ values

| $\#$ | Reaction | $\Delta \mathrm{H}^{\circ}$ |
| :---: | :---: | :---: |
| 1 | $\mathrm{C}+2 \mathrm{H}_{2} \rightarrow \mathrm{CH}_{4}$ | -74.80 kJ |

## Its just a puzzle!

Sometimes it's a really hard puzzle... but it's still just a puzzle!

All the pieces are there, you just have to figure out how to
 put them together...

Unfortunately no real "tricks" for how to figure out which parts to put together.
