# Dougherty Valley HS Chemistry - AP 

 Thermochemistry - Practice QuizName:
Period:
Seat\#:
Directions: Show all work in a way that would earn you credit on the AP Test! This is always the rule! Some answers are provided at the end in italics and underlined. If you need more space, use binder paper and staple to your worksheet.

$$
\Delta H^{\circ}=\Sigma \Delta H_{f}^{\circ} \text { products }-\Sigma \Delta H_{f}^{\circ} \text { reactants }
$$

1) Answer the following questions about the reaction of nitrogen gas and oxygen gas.
a) Calculate the amount of heat transferred when 10.00 g of $\mathrm{N}_{2} \mathrm{O}(\mathrm{g})$ is formed by the following reaction:
$2 \mathrm{~N}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{~N}_{2} \mathrm{O}(\mathrm{g}) \quad \Delta \mathrm{H}_{\mathrm{rxn}}=+163.2 \mathrm{~kJ}$
b) Draw and label an energy diagram for this process.
2) Predict the (+) or (-) algebraic sign for $\Delta H_{f}^{\circ}$ for the following scenarios and explain why:

| a) $\mathrm{Br}_{2}(\mathrm{~g})$ | c) $\mathrm{I}_{2}(\mathrm{~g})$ |
| :--- | :--- |
| b) $\mathrm{Br}_{2}(l)$ |  |
|  |  |
|  | d) $\mathrm{I}_{2}(\mathrm{~s})$ |

3) Calculate the $\Delta H_{r x n}^{\circ}$ for the following reaction:
$\mathbf{C}_{2} \mathbf{H}_{4}(\mathbf{g})+\mathbf{3 O}_{2}(\mathrm{~g}) \rightarrow \mathbf{2} \mathrm{CO}_{2}(\mathrm{~g})+\mathbf{2} \mathrm{H}_{2} \mathrm{O}(l)$
$\Delta H_{f}^{\circ} \mathrm{C}_{2} \mathrm{H}_{4}(\mathrm{~g})=226.6 \mathrm{~kJ} / \mathrm{mol}$
$\Delta H_{f}^{\circ} \mathrm{CO}_{2}(\mathrm{~g})=-393.5 \mathrm{~kJ} / \mathrm{mol}$
$\Delta H_{f}^{\circ} \mathrm{H}_{2} \mathrm{O}(l)=-285.8 \mathrm{~kJ} / \mathrm{mol}$

## Dougherty Valley HS Chemistry - AP

Thermochemistry - Practice Quiz
4) A 5.00 g sample of liquid water at $25.0^{\circ} \mathrm{C}$ is heated by the addition of 84.0 J of energy. Determine the final temperature of the water in ${ }^{\circ} \mathrm{C}$ ? (The specific heat capacity of the liquid is $4.18 \mathrm{~J} / \mathrm{g}^{\circ} \mathrm{C}$ ).
5) Propane is a hydrocarbon that is commonly used as a fuel for cooking. Propane's formula is $\mathrm{C}_{3} \mathrm{H}_{8}$.
a) Write a balanced equation for the complete combustion of propane gas.
b) Calculate the volume of air at $30^{\circ} \mathrm{C}$ and 1.00 atm that is needed to burn completely 10.0 g of propane. Assume that air is $21.0 \% \mathrm{O}_{2}$ by volume.
c) The heat of combustion ( $\Delta H_{\text {combustion }}^{\circ}$ ) is $-2,220.1 \mathrm{~kJ} / \mathrm{mol}$. Calculate the heat of formation, $\Delta H_{f}^{\circ}$, of propane given that $\Delta H_{f}^{\circ}$ of $\mathrm{H}_{2} \mathrm{O}()$ is $-285.3 \mathrm{~kJ} / \mathrm{mol}$ and $\Delta H_{f}^{\circ}$ of $\mathrm{CO}_{2}(\mathrm{~g})$ is $-393.5 \mathrm{~kJ} / \mathrm{mol}$.
d) Assuming that all of the heat evolved burning 10.0 g propane is transferred to 8.00 kg of water (specific heat $=4.184 \mathrm{~J} / \mathrm{g}^{\circ} \mathrm{C}$ ), calculate the increase in temperature of the water.
