## N7-THERMODYNAMICS

Gibbs Free Energy

## Now it is time for some math!

## Yay!

## Gibbs Free Energy

Gibbs free energy, $G$ - the maximum amount of work energy that can be released to the surroundings by a system for a constant temp and pressure system.

Gibbs free energy is often called the chemical potential because it is similar to the storing of energy in a mechanical system.

## Gibbs Free Energy

It can be shown that:

$$
-\mathrm{T} \Delta S_{\mathrm{univ}}=\Delta H_{\mathrm{sys}}-\mathrm{T} \Delta S_{\mathrm{sys}}
$$

This turns into...

## Gibbs Free Energy

It can be shown that:

$$
-\mathrm{T} \Delta S_{\mathrm{univ}}=\Delta H_{\mathrm{sys}}-\mathrm{T} \Delta S_{\mathrm{sys}}
$$

This turns into...

## Gibbs Free Energy

# $\Delta G_{\text {sys }}=\Delta H_{\text {sys }}-T \Delta S_{\text {sys }}$ 

## Important Equation!!!

## Gibbs Free Energy

$$
\begin{gathered}
-\mathrm{T} \Delta S_{\mathrm{univ}}=\Delta H_{\text {sys }}-\mathrm{T} \Delta S_{\text {sys }} \\
\Delta G_{\text {sys }}=\Delta H_{\text {sys }}-\mathrm{T} \Delta S_{\text {sys }}
\end{gathered}
$$

- Because $\Delta S_{\text {univ }}$ determines if a process is spontaneous, $\Delta G$ also determines spontaneity.
- $\Delta S_{\text {univ }}$ is positive when spontaneous, so $\Delta G$ is negative.

## Gibbs Free Energy

A process will be spontaneous when $\Delta G$ is negative

Important fact that lets us do a lot of math!

## Mental Math with Gibbs Free Energy

It is very common for them to ask you to predict if a reaction is spontaneous based on just the algebraic sign on $\Delta \mathrm{H}$ and $\Delta \mathrm{S}$

## You need to use the Gibbs equation to see if $\Delta \mathbf{G}$ ends up + or -

$$
\Delta G_{\text {sys }}=\Delta H_{\text {sys }}-T \Delta S_{\text {sys }}
$$

## Mental Math with Gibbs Free Energy

| $\Delta H_{\text {sys }}-T \Delta S_{\text {sys }}=\Delta G_{\text {sys }}$ |  |  |  |
| :---: | :---: | :---: | :---: |
| $\Delta H$ | $\Delta S$ | $\Delta G$ | At... |
|  |  | ALWAYS spont | Any temperature |
| (Negative \#) any $_{\text {any }} \mathbf{T}$ (Positive \#) = Always Negative \# |  |  |  |

Remember $T$ is in Kelvin, always a positive number

## Mental Math with Gibbs Free Energy

Notice the double negative! $\rightarrow$ (Positive \#) + (Positive \#)

## Mental Math with Gibbs Free Energy

$\Delta H_{\text {sys }}-T \Delta S_{\text {sys }}=\Delta G_{\text {sys }}$

|  | $\Delta H_{\text {sys }}-\mathrm{T} \Delta S_{\text {sys }}=\Delta G_{\text {sys }}$ |  |  |
| :---: | :---: | :---: | :---: |
| con $\Delta$ | $\Delta S$ | $\Delta G$ | At... |
| endothermic | more disorder | spont. | High Temp |

(Positive \#) - large $\mathbf{T}$ (Positive \#) = Negative \#
$\Delta H$ needs to be a smaller positive number than $T \Delta S_{\text {sys }}$ Small \# - Big \# = Negative \#

$$
\Delta H<T \Delta S_{\mathrm{sys}}
$$

## Mental Math with Gibbs Free Energy

$\Delta H_{\text {sys }}-T \Delta S_{\text {sys }}=\Delta G_{\text {sys }}$

(Negative \#) - small ${ }^{\text {T(Negative \#) }}$ = Negative \#
Notice the double negative! $\rightarrow$ (Negative \#) + (Positive \#) $\Delta H$ needs to be a larger negative than $\mathrm{T} \Delta S_{\text {sys }}$ $\Delta H<T \Delta S_{\text {sys }}$

## Mental Math with Gibbs Free Energy

## This always makes my brain feel scrambled... figure out what works for you.

- Flat out memorize it (best, fastest)
- Write out the equation and +/- and walk through the mental math each time (what I do because I'm lazy, and I'm not taking timed tests like you are - ha!)
- Find/make a mnemonic? (Tell me if you find a good one!)

> YOU CANT LET YOUR BRAIN SHUT DOWN
> Don't let it feel confused and shut off... just walk through it slowly...

| $\Delta H_{\text {sys }}-T \Delta S_{\text {sys }}=\Delta G_{\text {sys }}$ |  |  |  |
| :---: | :---: | :---: | :---: |
| $\Delta H$ | $\Delta S$ | $\Delta G$ | At... |
| exothermic | more disorder | ALWAYS spont. | Any temp |
| endothermic | less disorder | NEVER spont | Any temp |
| exothermic | less disorder | spont. | Low Temp |
| exothermic | less disorder | NOT spont. | High Temp |
| endothermic | more disorder | spont. | High Temp |
| endothermic | more disorder | NOT spont. | Low Temp |

So many versions online, find one you like! If you find a good one, always share with me! ©

## Gibbs at Equilibrium

## When $\Delta G=0$

the reaction is at equilibrium.

## Gibbs at Equilibrium

Gibbs Free Energy Determines the
Direction of Spontaneous Change

## Calculating Free Energy

## Method \#1- Gibbs-Helmohotz Equation

$$
\Delta G^{\circ}=\Delta H^{\circ}-T \Delta S^{\circ}
$$

For reactions at a constant temperature

## Calculating Free Energy

## Method \#2- A variation of Hess's Law

$$
\begin{array}{ll}
C_{\text {diamond }}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g}) & \Delta G^{0}=-397 \mathrm{~kJ} \\
C_{\text {graphite }}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g}) & \Delta G^{0}=-394 \mathrm{~kJ} \\
C_{\text {diamond }}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g}) & \Delta G^{0}=-397 \mathrm{~kJ} \\
\mathrm{CO}_{2}(\mathrm{~g}) \rightarrow C_{\text {graphite }}(\mathrm{s})+0 / 2(\mathrm{~g}) & \Delta G^{0}=+394 \mathrm{~kJ} \\
\hline C_{\text {diamond }}(\mathrm{s}) \rightarrow C_{\text {graphite }}(\mathrm{s}) & \Delta G^{0}=-3 \mathrm{~kJ}
\end{array}
$$

## Calculating Free Energy

## Method \#3- Standard Free Energy of Formations

$$
\Delta G^{0}=\sum n_{p} \Delta G_{f(\text { products })}^{0}-\sum n_{r} \Delta G_{f(\text { reactants })}^{0}
$$

$\Delta G_{f}{ }^{0}$ of an element in its standard state is zero

## Free Energy and Pressure

- Enthalpy, H, is not pressure dependent
- Entropy, S - yes pressure dependent
- Depends on volume, so also depends on pressure
- So Gibbs will change because $S$ changes
$\mathrm{S}_{\text {large volume }}>\mathrm{S}_{\text {small volume }}$
$\mathrm{S}_{\text {low pressure }}>\mathrm{S}_{\text {high pressure }}$

## Free Energy and Equilibrium

## $\Delta \mathbf{G}=\Delta \mathbf{G}^{\circ}+\mathbf{R T L n}(\mathbf{Q})$,

Where $\Delta \mathrm{G}$ is at some non standard condition, and $\Delta G^{0}$ is standard $1 \mathrm{~atm}, \mathrm{Q}$ is some condition not at equilibrium

Remember $-K=$ equilibrium, $Q=$ not at equilibrium $K=Q$ at equilibrium

## Free Energy and Equilibrium

Equilibrium point occurs at the lowest value of free energy available to the reaction system At equilibrium: $\Delta \mathrm{G}=0$ and $\mathrm{Q}=\mathrm{K}$

| $\Delta \mathbf{G}^{\mathbf{0}}$ | $\mathbf{K}$ |
| :---: | :---: |
| $\Delta \mathrm{G}^{0}=0$ | $\mathrm{~K}=1$ |
| $\Delta \mathrm{G}^{0}<0$ | $\mathrm{~K}>1$ |
| $\Delta \mathrm{G}^{0}>0$ | $\mathrm{~K}<1$ |

## Free Energy and Equilibrium

$$
\Delta G=\Delta \mathbf{G}^{\circ}+\mathbf{R T L n}(\mathbf{Q})
$$

So if at equilibrium $\Delta G=0$ and $K=Q \ldots$

$$
0=\Delta G^{\circ}+R T \operatorname{Ln}(K)
$$

Then rearrange...

$$
\Delta G^{\circ}=-\operatorname{RTLn}(K)
$$

where $R=8.314 \mathrm{~J} / \mathrm{mol} \cdot \mathrm{K}$

## Reminder....

If you use the Hess's Law style method for Gibbs problems, where you have to add together various rxns, you need to edit your Keq value when you add/multiply your equations!

Multiplying an Equation - Raise K to that exponent Double the $\mathrm{Rxn}=\mathrm{K}^{2} \quad$ Half the $\mathrm{Rxn}=\mathrm{K}^{1 / 2}$
Adding Reactions at the End - Multiply K values

$$
\mathrm{K}_{\text {overall }}=\mathrm{K}_{1} \times \mathrm{K}_{2} \times \mathrm{K}_{3} \text {, etc }
$$

Then you can do things like $-\Delta G^{\circ}=-R T \operatorname{Ln}(K)$

## Free Energy and Equilibrium

So if...

$$
\Delta G^{\circ}=-\operatorname{RTLn}(K)
$$

And if...

$$
\Delta G^{\circ}=\Delta H^{\circ}-T \Delta S^{\circ}
$$

Then...

$$
\Delta G^{0}=-R T \ln (K)=\Delta H^{0}-T \Delta S^{0}
$$

## Free Energy and Equilibrium

$$
\Delta G^{0}=-R T \ln (K)=\Delta H^{0}-T \Delta S^{0}
$$

Rearrange to solve for $\ln (\mathrm{K}) \ldots$

$$
\ln (K)=-\frac{\Delta H^{0}}{R T}+\frac{\Delta S^{0}}{R}=-\frac{\Delta H^{0}}{R}\left(\frac{1}{T}\right)+\frac{\Delta S^{0}}{R}
$$

So.... $\ln (K) \propto 1 / T$
And that equation looks like $\mathrm{y}=\mathrm{mx}+\mathrm{b} . .$.

## Free Energy and Equilibrium

You can find $\Delta \mathbf{H}^{\circ}$ and $\Delta \mathbf{S}^{\circ}$ by graphing!

$$
\begin{aligned}
\ln (\mathrm{K}) & =-\frac{\Delta H^{\circ}}{R}\left(\frac{1}{T}\right)+\frac{\Delta S^{\circ}}{R} \\
\mathbf{y} & =\mathrm{m} \quad \mathrm{x}+\mathrm{b}
\end{aligned}
$$

$1^{\text {st }}$ - Graph $\operatorname{In}(\mathrm{K})$ vs $\left(\frac{1}{T}\right)$
$2^{\text {nd }}$ - Find line of best fit (Excel or graphing calculator)
$3^{\text {rd }}-$ Slope $=-\frac{\Delta H^{\circ}}{R} \quad$ Intercept $=\frac{\Delta S^{\circ}}{R}$

## Soooo many rearrangements...

- There are so many ways to rearrange, substitute, and solve for various things when it comes to Thermodynamics.

## You HAVE to have decent algebra skills!

- My best advice if algebra is not your strong suit...
-Practice over and over until it becomes "muscle memory" how to rearrange.
-Every time you have a question that requires a different equation rearrangement/substitution, write it down! Start making your own equation cheat sheet.

For the Rx: $\mathbf{2 N O}(\mathrm{g})+\mathbf{O}_{\mathbf{2}}(\mathrm{g}) \rightarrow \mathbf{2} \mathbf{N O}_{\mathbf{2}}(\mathrm{g}) \Delta \mathrm{S}^{\circ}{ }_{\mathrm{rxn}}=-146.5 \mathrm{~J} / \mathrm{mol} \cdot \mathrm{K}$ Calculate the standard molar entropy of $\mathrm{O}_{2}(\mathrm{~g})$. $\Delta \mathrm{S}^{\circ}{ }_{\mathrm{NO}(\mathrm{g})}=210.8 \mathrm{~J} / \mathrm{mol} \bullet \mathrm{K}, \Delta \mathrm{S}^{\circ}{ }_{\mathrm{NO} 2(\mathrm{~g})}=240.1 \mathrm{~J} / \mathrm{mol} \cdot \mathrm{K}$
(A) $-175.8 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}$
(B) $269.4 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}$

C $-205.1 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}$
(D $\quad 205.1 \mathrm{Jmol}^{-1} \mathrm{~K}^{-1}$
E None of the above

For the Rx: $\mathbf{2 N O}(\mathrm{g})+\mathbf{O}_{\mathbf{2}}(\mathrm{g}) \rightarrow \mathbf{2} \mathbf{N O}_{\mathbf{2}}(\mathrm{g}) \Delta \mathrm{S}^{\circ}{ }_{\mathrm{rxn}}=-146.5 \mathrm{~J} / \mathrm{mol} \bullet \mathrm{K}$ Calculate the standard molar entropy of $\mathrm{O}_{2}(\mathrm{~g})$. $\Delta \mathrm{S}^{\circ}{ }_{\mathrm{NO}(\mathrm{g})}=210.8 \mathrm{~J} / \mathrm{mol} \bullet \mathrm{K}, \Delta \mathrm{S}^{\circ}{ }_{\mathrm{NO} 2(\mathrm{~g})}=240.1 \mathrm{~J} / \mathrm{mol} \cdot \mathrm{K}$
(A) $-175.8 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}$

$$
\Delta S_{r x n}=\Sigma \Delta S_{\text {Products }}-\Sigma \Delta S_{\text {reactants }}
$$

B $269.4 \mathrm{Jmol}^{-1} \mathrm{~K}^{-1}$

$$
(-146.5)=[2(240.1)]-\left[2(210.8)+\Delta \mathrm{S}^{\circ}{ }_{02}\right]
$$

C $-205.1 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}$
D $205.1 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}$
E None of the above

## For the following Rx: $\mathbf{N}_{\mathbf{2}}(\mathrm{g})+\mathbf{H}_{\mathbf{2}}(\mathrm{g}) \rightarrow \mathbf{N H}_{\mathbf{3}}(\mathrm{g})$

Calculate the standard Free Energy, $\Delta \mathrm{G}^{\circ}$ for the rxn at $25^{\circ} \mathrm{C}$. $\Delta H^{\circ}=-264 \mathrm{~kJ} / \mathrm{mol} \quad \Delta S^{\circ}=-278 \mathrm{~J} / \mathrm{mol} \cdot \mathrm{K}$
(A) $-82.5 \mathrm{KJ} \mathrm{mol}^{-1}$
(B) $-181 \mathrm{~kJ} \mathrm{~mol}^{-1}$

C $-6686 \mathrm{KJ} \mathrm{mol}^{-1}$
(D) $181 \mathrm{~kJ} \mathrm{~mol}^{-1}$

E None of the above

For the following Rx: $\mathbf{N}_{\mathbf{2}}(\mathrm{g})+\mathbf{H}_{\mathbf{2}}(\mathrm{g}) \rightarrow \mathbf{N H}_{3}(\mathrm{~g})$
Calculate the standard Free Energy, $\Delta \mathrm{G}^{\circ}$ for the rxn at $25^{\circ} \mathrm{C}$. $\Delta H^{\circ}=-264 \mathrm{~kJ} / \mathrm{mol} \quad \Delta S^{\circ}=-278 \mathrm{~J} / \mathrm{mol} \cdot \mathrm{K}$
(A) $-82.5 \mathrm{KJ} \mathrm{mol}^{-1}$

$$
\Delta \mathbf{G}^{\circ}=\Delta \mathbf{H}^{\circ}-\mathbf{T} \Delta \mathbf{S}^{\circ}
$$

$$
\Delta G^{\circ}=(-264)-298(-0.278)
$$

$$
\Delta \mathrm{G}^{\circ}=-181 \mathrm{KJ} \mathrm{~mol}^{-1}
$$

Careful about units matching! H and S usually don't match! Convert before you use them!
E None of the above

## Calculate the Boiling Point of $\mathrm{BCI}_{3}$.

 $\mathrm{BCl}_{3(\mathrm{f}} \leftrightarrow \mathrm{BCl}_{3(\mathrm{~g})}$. Given:|  | $\Delta \mathbf{H}^{\circ}{ }_{\mathbf{f}}$ <br> $\mathbf{k J / m o l}$ | $\mathbf{S}^{\circ}$ <br> $\mathbf{J} / \mathbf{m o l} \mathbf{k}$ |
| :--- | :---: | :---: |
| $\mathrm{BCl}_{3}($ ( ) | -418 | 209 |
| $\mathrm{BCl}_{3}(\mathrm{~g})$ | -395 | 290 |

(A) 352 K
(B) 275 K

C 322 K
(D) 284 K
(E) 10 K

## Calculate the Boiling Point of $\mathrm{BCl}_{3}$.

## $\mathrm{BCl}_{3(\mathrm{n}} \leftrightarrow \mathrm{BCl}_{3(\mathrm{~g})}$. Given:

Phase change - at equilibrium!
So $\Delta \mathbf{G}=0$

|  | $\Delta \mathbf{H}^{\circ}{ }^{\mathbf{i}}$ <br> $\mathbf{k J} / \mathbf{m o l}$ | $\Delta \mathbf{S}^{\circ}$ <br> $\mathbf{J} / \mathbf{m o l} \mathbf{k}$ |
| :--- | :---: | :---: |
| $\mathrm{BCl}_{3}(\mathrm{n})$ | -418 | 209 |
| $\mathrm{BCl}_{3}(\mathrm{~g})$ | -395 | 290 |

(A) 352 K
(B) 275 K

$$
\Delta \mathbf{G}^{\circ}=\Delta \mathbf{H}^{\circ}-\mathbf{T} \Delta \mathbf{S}^{\circ}
$$

C 322 K
$0=(-395-418)-T(0.290-0.209)$
(D) 284 K
$\mathrm{T}=284 \mathrm{~K}$
(E) 10 K

What is $\Delta \mathrm{G}^{\circ}$ for the following $R x @ 25.0^{\circ} \mathrm{C}$ :
$2 \mathrm{NH}_{3}(\mathrm{~g}) \rightarrow \mathbf{N}_{2}(\mathrm{~g})+3 \mathbf{H}_{\mathbf{2}}(\mathrm{g}) \quad \Delta \mathrm{H}^{\circ}=92.4 \mathrm{~kJ}, \Delta \mathrm{~S}^{\circ}=198 \mathrm{~J} / \mathrm{K}$
(A) -58911.6 kJ

B $33.40 \mathrm{~kJ} \quad \Delta \mathbf{G}^{\circ}=\Delta \mathbf{H}^{\circ}-\mathbf{T} \Delta \mathbf{S}^{\circ}$
C $-497.64 \mathrm{~kJ} \quad \Delta \mathrm{G}^{\circ}=(92.4)-298(0.198)$
(D) $87.45 \mathrm{~kJ} \quad \Delta \mathrm{G}^{\circ}=33.4 \mathrm{~kJ}$
(E) -4857.6 kJ

What is $\Delta \mathrm{G}^{\circ}$ for the following $R x @ 25.0^{\circ} \mathrm{C}$ :
$2 \mathrm{NH}_{3}(\mathrm{~g}) \rightarrow \mathbf{N}_{\mathbf{2}}(\mathrm{g})+3 \mathbf{H}_{\mathbf{2}}(\mathrm{g}) \quad \Delta \mathrm{H}^{\circ}=92.4 \mathrm{~kJ}, \Delta \mathrm{~S}^{\circ}=198 \mathrm{~J} / \mathrm{K}$
(A) -58911.6 kJ

B $33.40 \mathrm{~kJ} \quad \Delta \mathbf{G}^{\circ}=\Delta \mathbf{H}^{\circ}-\mathbf{T} \Delta \mathbf{S}^{\circ}$
C $-497.64 \mathrm{~kJ} \quad \Delta \mathrm{G}^{\circ}=(92.4)-298(0.198)$
(D) $87.45 \mathrm{~kJ} \quad \Delta \mathrm{G}^{\circ}=33.4 \mathrm{~kJ}$
(E) -4857.6 kJ

Under standard conditions ( 1 atm of $\mathrm{NH}_{3}, \mathrm{~N}_{2}$ and $\mathrm{H}_{2}$ ) and at 298 K , what will be formed? $\left(\Delta \mathrm{G}^{\circ}=33.4 \mathrm{~kJ}\right)$
$2 \mathrm{NH}_{3}(\mathrm{~g}) \rightarrow \mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g})$
(A) $\mathrm{NH}_{3}$

B $\mathrm{N}_{2}$ and $\mathrm{H}_{2}$
C Equal amounts of all three gases
D Need more information

Under standard conditions ( 1 atm of $\mathrm{NH}_{3}, \mathrm{~N}_{2}$ and $\mathrm{H}_{2}$ ) and at 298 K , what will be formed? $\left(\Delta \mathrm{G}^{\circ}=33.4 \mathrm{~kJ}\right)$
$2 \mathrm{NH}_{3}(\mathrm{~g}) \rightarrow \mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g})$
(A) $\mathrm{NH}_{3}$

B $\mathrm{N}_{2}$ and $\mathrm{H}_{2}$
$\Delta \mathbf{G}=+$ so not spontaneous in reverse direction, reactants will be produced not products

C Equal amounts of all three gases
D Need more information

Calculate the equilibrium constant for this reaction at 298 K . $\mathbf{2} \mathbf{N H}_{\mathbf{3}}(\mathrm{g}) \rightarrow \mathbf{N}_{\mathbf{2}}(\mathrm{g})+\mathbf{3} \mathbf{H}_{\mathbf{2}}(\mathrm{g})\left(\Delta \mathrm{G}^{\circ}=33.4 \mathrm{~kJ}\right)$
(A) 1.014
(B) 609048.5

C $\quad 1.397 \mathrm{E}-6$
D Need to know equilibrium [ ]'s to calculate Keq

Calculate the equilibrium constant for this reaction at 298 K . $2 \mathrm{NH}_{3}(\mathrm{~g}) \rightarrow \mathbf{N}_{\mathbf{2}}(\mathrm{g})+3 \mathrm{H}_{\mathbf{2}}(\mathrm{g})\left(\Delta \mathrm{G}^{\circ}=33.4 \mathrm{~kJ}\right)$

$$
\Delta \mathbf{G}^{\circ}=-\mathrm{RT} \ln (\mathrm{~K})
$$

(A) 1.014 $33400=-(8.314)(298) \ln (K)$
(B 609048.5
$-13.48=\ln (K)$
C $\quad 1.397 \mathrm{E}-6$

$$
e^{x}=y \quad \ln (y)=x \quad e^{-13.48}=K
$$

D Need to know

$$
\mathrm{K}=1.397 \times 10^{-6}
$$
