Directions: Show all work in a way that would earn you credit on the AP Test! This is always the rule! Some answers are provided at the end in italics and underlined. If you need more space, use binder paper and staple to your worksheet.

First-Order Reactions: (rate is directly proportional to the concentration)

$$
\text { Rate }=-\frac{\Delta[\mathrm{R}]}{\Delta \mathrm{t}}=\mathrm{k}[\mathrm{R}]
$$

using calculus, as the $\Delta t$ approaches 0 , the Rate equation becomes

$$
\ln \left(\frac{[R]_{t}}{[R]_{0}}\right)=k t
$$

which can be rearranged into the " $y=m x+b$ " format

$$
\ln [R]_{t}=-k t+\ln [R]_{0}
$$

so... IF the reaction is first-order with respect to $R$,
plotting $\ln [R]_{\mathrm{t}}$ versus time results in a straight line with $\mathbf{k}=$-slope
