$$
1 \mathrm{~atm}=760 \mathrm{mmHg}=760 \text { torr }=101.3 \mathrm{kPa}=14.7 \mathrm{psi}
$$

## Background:

Pressure is defined as Force / Area such as pounds per square inch (psi).
The weight of air pushing down per square inch is 14.7 pounds per square inch or 14.7 psi .
A barometer can be used to measure pressure. A column of mercury ( Hg ) that is 0.760 meter ( 760 mm ) tall has the same weight as a column of air from sea level to the edge of the stratosphere. The height of this column is a good measure of air pressure... 760 mmHg .

Evangelista Torricelli did a lot of experiments with pressure and so 1 mmHg is also called 1 torr. So, air pressure has a value of 760 torr. This amount of pressure is also called 1 atm (one atmosphere) because it IS the atmosphere.

In metric units, pressure if Newtons (force) per square meter (area). One Newton is not very much pressure... about the weight of a small apple (get it... apple... Newton)... and if that force is exerted over a square meter, the amount of pressure is very small and called a pascal ( Pa ). It is more useful to talk of kilopascals ( kPa ) which would be the weight of 1000 small apples exerted over a square meter. Air pressure is equal to 101.3 kPa .

Since each of these values (see the top of the page) represent the same amount of pressure, any two of them can be used as a conversion factor. You can convert one pressure unit into another.

$$
\text { What is } 515 \mathrm{mmHg} \text { in } \mathrm{kPa} \text { ? } 515 \mathrm{mmHg} x \frac{101.3 \mathrm{kPa}}{760 \mathrm{mmHg}}=68.6440789 \mathrm{kPa}=68.4 \mathrm{kPa}
$$

## EXAMPLE:

PRACTICE:

| 745 mmHg into psi | 522 torr into kPa |
| :--- | :--- |
| 727 mmHg into kPa | 1.10 atm into psi |
|  |  |
| 52.5 kPa into atm | $800 . \mathrm{mmHg}$ into atm |
| 0.729 atm into mmHg | 125 kPa into torr |
